Installation

### ONEDETECTOR AP **Optical And Thermal Detector** With Short Circuit Isolator

### Description

ONEDETECTOR\_AP continuously samples the air condition and temperature of the protected area to provide the earliest warning of fire and vet offers a high level of false alarm rejection.

Each detector is provided with an integrated isolator circuit, that automatically takes action in case of need.

The ONEPROTOCOLL employed by the monitoring control panel provides high rates of information

ONEDETECTOR\_AP benefits from a "dust trap" that limiting potential contamination and extending periods between maintenance without compromising sensitivity of response.

ONEDETECTOR\_AP must only be connected to control panels that use the ONEPROTOCOLL proprietary analogue intelligent addressable communication protocol.

The address can be programmed by mean of the ONEPROGRAMMER\_AP or with the addressing function of Teledata smoke detection.

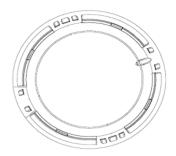

ONEDETECTOR\_AP is provided with tools for base numbering and locking pin against unwanted removal.

### **Technical Specifications**

Supply voltage range	18 ~ 27V
Stand by consumption	190μΑ
Alarm current	6 mA (LED on)
Remote output max current	15 mA
Operating temperature range	-30°C ~ +70°C
Humidity	95% RH (no condensation)
Height with standard base	48 mm
Diameter	92 mm
Weight with standard base	120 g

20063 Cernusco sul Naviglio (MI) - Via Brescia 24 G - Italy

### **Short Circuit Isolator**

All standard series devices are provided with short-circuit monitoring isolators on the intelligent loop's line and can be activated by the control panel.

### **Features**

- Low profile optical and thermal detector to be combined with ONEBASE\_AP
- Built with ABS plastic material with stabilized UV
- compact design, and aesthetical impact
- Integrated self adapting function, to suit enviromental changes
- Remote LED control option

www.TeledataOne.com

This ONEDETECTOR\_AP must be used in combination with compatible control panels employing the ONEPROTOCOLL communication protocol.

ONEDETECTOR\_AP must be mounted on **ONEBASE** 

ONEBASE\_AP supplied with a metal shorting spring installed between the two negative terminals and permits the continuity of the loop cabling to be tested after installation.

Connections to the ONEBASE\_AP terminals are polarity sensitive, please check the wiring diagram in figure 2.

### **Remote Output Capability**

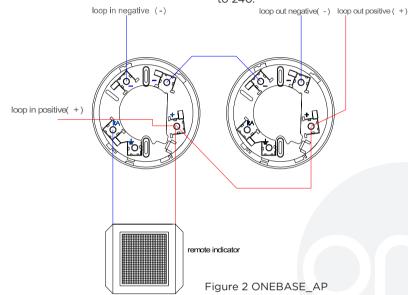

Remote output capability is available as a standard feature so a remote indication lamp or a compatible platform sounder (check power requirements) may be wired to the base terminals.

If other equipment is connected to the remote output, its supply current must be eventually limited by using an adequate resistor. Consult the TECHNICAL SPECIFICATIONS table and assess the external device current absorption's value.

### Setting The Address

ONEDETECTOR\_AP can be addressed using a special hand-held programmer unit "ONEPROGRAMMER\_AP"

Addresses may be selected from a range from1 to 240.

ONEDETECTOR\_AP Optical And Thermal Detector With Short Circuit Isolator

## #FTeledataone

ONEDETECTOR\_AP Optical And Thermal Detector With Short Circuit Isolator

### **Sensitivity Settings**

Teledata

A choice of four sensitivity levels are available by control panel selection. Level 1 is most sensitive, level 4 is least sensitive.

### **ONEDETECTOR Mounting**

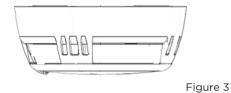

- Position ONEDETECTOR\_AP centrally on it's ONEBASE\_AP
- Rotate clockwise, ONEDETECTOR\_AP will drop into its keyed location
- Press more firmly to win the force of the contact springs
- Continue to rotate a few degrees until the ONEDETECTOR\_AP has fully engaged in the ONEBASE\_AP. (Fig3)
- Verify the alignment between the ONEDETECTOR\_AP and the raised reference marks on the ONEBASE\_ AP.(Fig4)
- Test ONEDETECTOR\_AP as described in the section TESTING

### **Mechanical Block Feature**

ONEDETECTOR AP can be locked on ONEBASE\_AP by removing the small plastic pin and then inserting it in the appropriate slot on the side of ONEBASE\_AP, see figure 5 part 1 and part 3.

To unlock the ONEDETECTOR\_AP from its ONEBASE AP. simply push the inserted pin towards the inside of the ONEBASE\_AP using a small screwdrive.

In ONEBASE AP there is also a detachable label to be inserted outside the ONEBASE\_AP to identify the loop number and the sensor address, see figure 5 part 2.

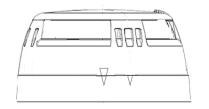

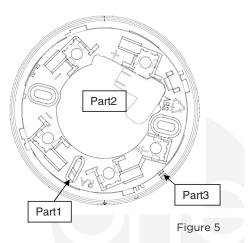

Figure 4

### Testing

ONEDETECTOR\_AP can be tested after installation and during maintenance using the aerosol test and hair dryer or an heat tool. For this test, approved aerosols should be used to prevent damage and possible contamination of the sensor.

Teledata suggests using the special applicator to spray the aerosol.

ONEDETECTOR\_AP will send an alarm message to the control panel.

If ONEDETECTOR\_AP does not respond correctly to the test, it may be necessary to clean it, in this case the instructions in the maintenance chapter must be followed

### Maintenance

ONEDETECTOR\_AP Remove from mounting ONEBASE\_AP, inspect the smoke entry windows and the thermistor area, use a small, soft bristle brush to dislodge any evident contaminants such as insects, hair, ecc. Use a small vacuum tube or clean, dry and compressed air to suck up or blow away any remaining small particles from the smoke entry screen area and thermistor area. Use ONEPROGRAMMER\_AP unit to read the percentage of dirt in the optical chamber, please refer to the ONEPROGRAMMER\_AP instruction manual.

Reposition ONEDETECTOR\_AP on your mounting ONEBASE\_AP and check correct operation as described under the testing paragraph.

### **Warnings And Limitations**

Our devices use high quality electronic components and plastic materials that are highly resistant to environmental deterioration. However, after 10 years of continuous operation, it is advisable to replace the devices in order to minimize the risk of reduced performance caused by external factors. Ensure that this device is only used with compatible control panels. Detection systems must be checked, serviced and maintained on a regular basis to confirm correct operation.

Smoke sensors may respond differently to various kinds of smoke particles, thus application advice should be sought for special risks. Sensors cannot respond correctly if barriers exist between them and the fire location and may be affected by special environmental conditions. Refer to and follow national codes of practice and other internationally recognized fire engineering standards.

Appropriate risk assessment should be carried out initially to determine correct design criteria and updated periodically.

### Warranty

This warranty is invalidated by mechanical or electrical damage caused in the field by incorrect handling or usage

Product must be returned via your authorized supplier for repair or replacement together with full information on any problem identified.

Full details on our warranty and product's returns policy can be obtained upon request
